Re: **Material Information**

Dear Sir,

In accordance with the Listing Regulations, as per information received from MOL, the operator of TAL Block, hydrocarbons have been encountered in exploratory well Mamikhel South-01, which has been drilled and is currently under testing phase. As a result of Drill Stem Test (DST) conducted at the well to test the potential of Lockhart and Hungu formations, the well has tested 3,240 barrels per day of condensate, 16.12 MMscf of gas per day and 48 barrels per day of water at 32/64" fixed choke size at the flowing wellhead pressure of 4,476 psi.

A drill stem Test (DST) is a procedure for isolating and testing the surrounding geological formations through the drill stem. The test is a measurement of pressure behavior at the drill stem and is a way to obtain important fluid sampling information and to establish the probability of commercial production. Accordingly it should be borne in mind that actual production may differ significantly from the test results.

The pre-commerciality working interest of Pakistan Oilfields Limited is (25%).

Yours faithfully,  
For Pakistan Oilfields Limited

  
Syed Khalid Nafees  
Company Secretary
